"Crystal structure of bullfrog M ferritin at 2.8 A resolution:
analysis of subunit interactions and the binuclear metal center.";
J. Biol. Inorg. Chem. 4:243-256(1999).
-!- FUNCTION: Ferritin is an intracellular molecule that stores iron in a soluble, nontoxic, readily available form. The functional molecule, which is composed of 24 chains, is roughly spherical and contains a central cavity into which the polymeric ferric iron
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MISCELLANEOUS: THERE ARE THREE TYPES OF PERRITIN SUBUNITS: L, M AND H CHAINS IN AMPHIBIA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, J02724; .-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --- FUNCTION: Participates in the control of cell fate choice by uncommitted neurodectodermal cells in the embryo. Transcriptional repression moifse: 5'-CACNAG-3'.

--- SUBJURIT: Transcription repression requires formation of a complex with a co-repressor protein (Groucho). Forms homodimers.

--- SUBSILIULAR LOCATION: Nuclear (Probable).

--- SUBSILIULAR LOCATION: Nuclear (Probable).

--- DEVELOPMENTAL STAGE: Expressed at the time when separation of neural and epidermal precursors cells occurs. Mesectodermal expression appears shortly before the onset of gastrulation.

--- DOMAIN: The orange domain and the basic helix-loop-helix motific mediate prepression of specific transcriptional activators, such as basic helix-loop-helix protein dimers.

--- DOMAIN: The C-terminal WEWFW motifies a transcriptional repression domain necessary for the interaction with Groucho, a transcriptional co-repressor recruited to specific target DNA by Hairy-related proteins.

--- SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDIINE=95094252; PubMed=8001118; Paroush Z., Finley R.L. Munson R.S. Jr., Ray W.C., Mahairas G., Sabo P., Mungur R.,
Annoson L., Nguyen D., Wang J., Forst C., Hood L.;
In "The complete genome sequence of Haemophilus ducrey!.";
Submitted (JUN-2003) to the EMBL/GenBank/DDBJ databases.
I. FUNCTION: Catalyzes a salvage reaction resulting in the formation of AMP, that is energically less costly than de novo synthesis.
C. !- CATALYTIC ACTIVITY: AMP + diphosphate = adenine + 5-phospho-alpha-D-ribosos 1-diphosphate.
C. I. CATALYTIC HOMOdimer (By similarity).
C. !- PATHWAY: Purine salvage.
C. !- SUBUNIT: Homodimer (By similarity).
C. !- SUBCATION: Cytoplasmic.
C. !- SUBCATION: Belongs to the purine/pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. Ubiquinol-cytochrome C reductase iron-sulfur subunit (EC 1.10.2.2)
(Rieske iron-sulfur protein) (RISP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      gubunits.",
J. Biol. Chem. 262:13805-13811(1987).
-!-FUNCTION: Component of the ubiquinol-cytochrome c reductase
complex (complex III or cytochrome b-c1 complex), which is a
respiratory chain that generates an electrochemical potential
coupled to ATP synthesis.
-!-CATALYTIC ACTIVITY: QH(2) + 2 ferricytochrome c = Q + 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ferrocytochrome c.

Struct. Biol. 6:691-696 (1999).
-!- FUNCTION: CAN EFFICIENTLY HYDROLYZE NONSTANDARD NUCLEOTIDES SUCH
AS XTP TO XMP OR ITP TO IMP, BUT NOT THE STANDARD NUCLEOTIDES. XTP
IS THE BEST SUBSTRATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

                                                                                                                                                                                         for efficient antibody responses.
-!- CATALYTIC ACTIVITY: Cytidine + H(2)O = uridine + NH(3).
-!- COFACTOR: Zinc (By similarity).
-!- SIMILARITY: Belongs to the cytidine and deoxycytidylate deaminases
                                                                                            J. Biol. Chem. 274:18470-18476(1999).
-I- FUNCTION: RNA-editing deaminase involved in somatic hypermutation, gene conversion, and Class-switch recombination. Required for several crucial steps of B-cell terminal differentiation necessary
Davidson N.O., Honjo T.; "Specific expression of activation-induced cytidine deaminase (AID), a "Specific expression of activation-induced cytidine deaminase (AID), a novel member of the RNA-editing deaminase family in germinal center B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SEQUENCE FROM N.A.

Tre CONTION: 1GPS catalyzes the conversion of PRFAR and glutamine to IGP, AICAR and glutamate. The hisH subunit provides the glutamine aniotransferase activity that produces the ammonia necessary to hisF for the synthesis of IGP and AICAR (By similarity).

C. CATALYTIC ACTIVITY: 5-[(5-phospho-1-deoxyribulos-1-charboxamide + L-glutamine = imidacol-glycerol phosphate + 5-charboxamide - imidacol-glycerol phosphate + 15-charboxamide ribonucleotide + L-glutamate + H(2)0.

C. PATHMAY: Histidine biosynthesis; fifth step.

C. SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

C. SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

C. SUBCELLULAR LOCATION: Cytoplasmic emidotransferase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

DISEASE: Defects in RBP4 are a cause of retinol-binding protein DISEASE: Defects in RBP4 are a cause of retinol-binding protein deficiency [MIM:180250]. This condition causes night vision problems. It produces a typical "fundus xerophthalmicus," featuring a progressed atrophy of the retinal pigment epithelium. DISEASE: A deficiency of vitemin A blocks secretion of the binding protein posttranslationally and results in defective delivery and supply of vitemin to the epidermal cells (a condition associated with a dermatosis).

Terinol-binding proceins.

I J. Biol. Chem. 260:4726-878 (1985).

- I- FUNCTION: Delivers retinol from the liver stores to the peripheral tissues. In plasma, the RBP-retinol complex interacts with transthyretin, this prevents its loss by filtration through the kidney glomeruli.

C - SUMCENIULAR LOCATION: Secreted.

- SUMCENIULAR LOCATION: Secreted.

-!- PUNCTION: Delivers retinol from the liver stores to the peripheral tissues. In plasms. The RBP-retinol complex interacts with transthyretin, this prevents its loss by filtration through the kidney glomerall.
-!- SUBCELUTAR LOCATION: Secreted.

Nat. Struct. Biol. 7:224-229(2000).

-! FUNCTION: REQUIRED FOR THE EXECUTION OF THE MITOTIC CHECKPOINT WHICH MONITORS THE PROCESS OF KINETOCHORE-SPINDLE ATTACHMENT AND DELAYS THE ONSET OF ANAPHASE WHEN THIS PROCESS IS NOT COMPLETE. IT INRIBITS THE ACTIVITY OF THE ANAPHASE PROMOTING COMPLETE. IT SEQUESTERING CDC20 UNTIL ALL CHROMOSOMES ARE ALIGNED AT THE METAPHASE PLATE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=99458684; PubMed=10527948; Nelson K.K., Schlondorff J., Blobel C.P.; Nelson K.K., Schlondorff J., Blobel C.P.; Nelson K.K., Schlondorff J., Blobel C.P.; Isvidence for an interaction of the metalloprotease-disintegrin tumour necrosis factor alpha convertase (TACE) with mitotic arrest deficient 2 (MAD2), and of the metalloprotease-disintegrin MDC9 with a novel MAD2-related protein, MAD2-beta."; Blochem. A -> GS (IN REF. 1).
N -> H (IN REF. 1).
-!- FUNCTION: Allows the bacteria to use the host heme as an iron source. Involved in the oxidation of heme and subsequent release of iron from the heme moiety.
-!- CATALYTIC ACTIVITY: Heme + 3 AH(2) + 0(2) = biliverdin + Fe(2+) + CO + 3 A + 3 H(2)0.
-!- SIMILARITY: Belongs to the heme oxygenase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Flant Moi. Biol. Rep. 13:333-335(1995).
-!- SUBDINIT: Part of the 30S ribosomal subunit.
-! SUBCELLULAR LOCATION: Chloroplast.
-!- SUBLIARITY: Belongs to the S3P family of ribosomal proteins.
-!- SIMILARITY: Contains 1 KH type-2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                             "Complete genomic sequence of Corynebacterium glutamicum ATCC 13032.";
Submitted (MAY-2002) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Methyltransferase required for the conversion of
dimethylmenaquinone (DMKH2) to menaquinone (MKH2) (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + demethylmenaquinol =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps
